UNIVERSITET

Universal Dependencies

A Framework for Morphosyntactic Annotation

Joakim Nivre

Uppsala University

Department of Linguistics and Philology

Based on collaborative work with Marie-Catherine de Marneffe, Filip Ginter, Yoav Goldberg, Jan Hajic, Christopher Manning, Ryan McDonald, Natalia Silveira, Slav Petrov, Sampo Pyysalo, Sebastian Schuster, Reut Tsarfaty, Francis Tyers, Daniel Zeman and many others

Why?

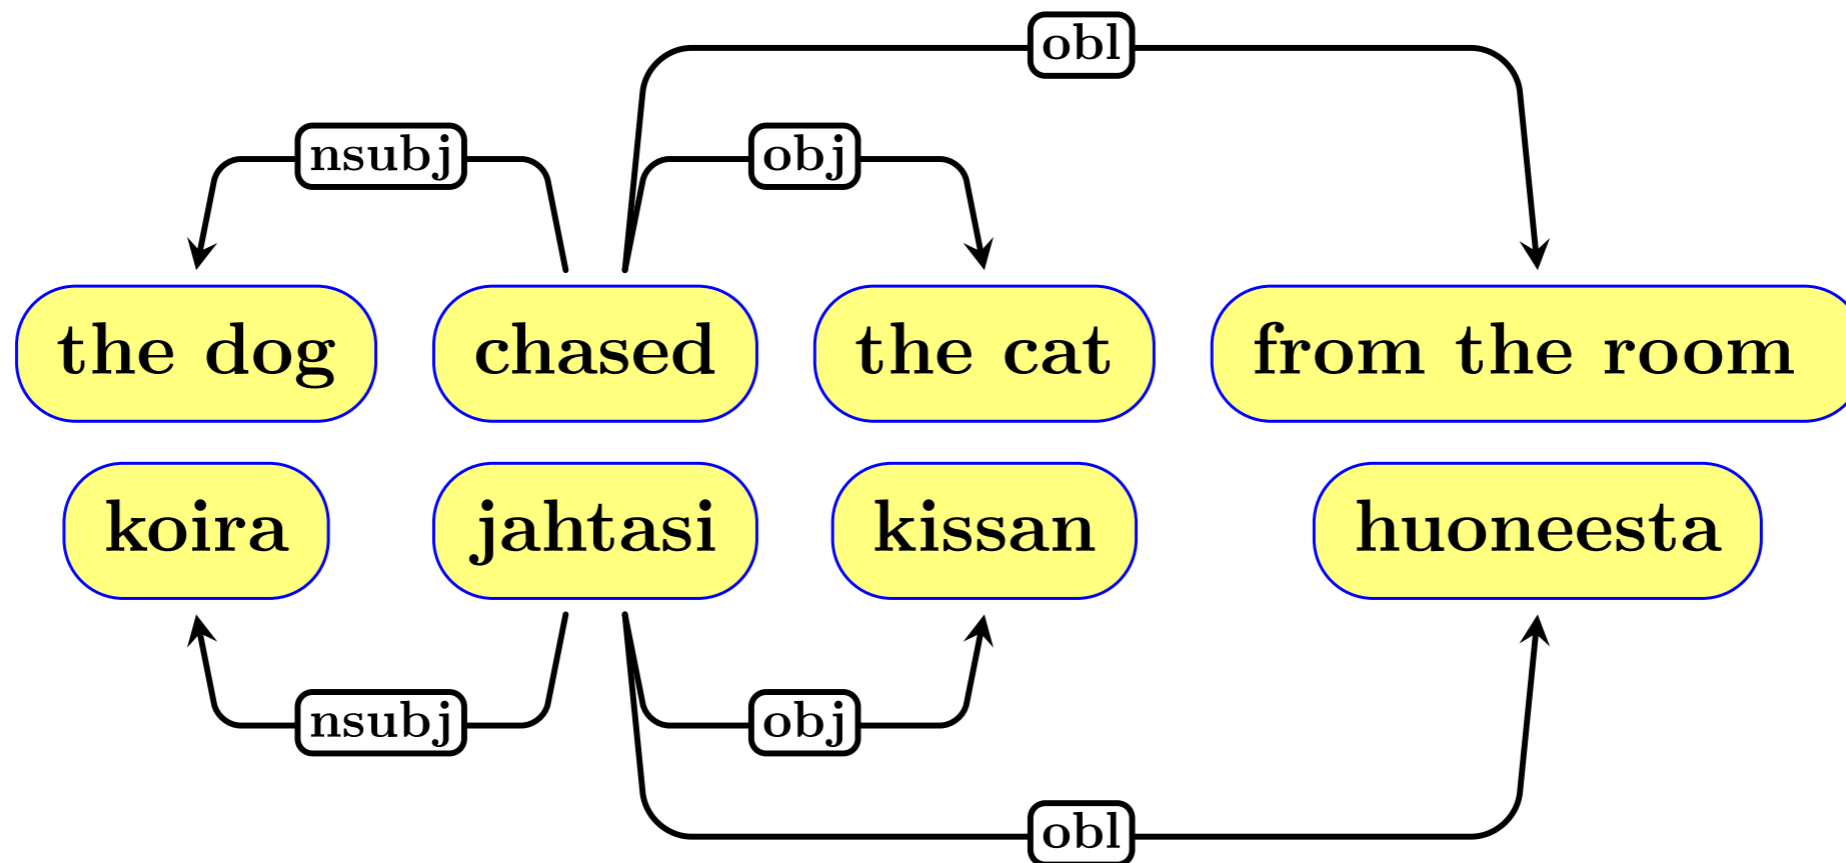

Cross-linguistically consistent morphosyntactic annotation

Facilitate multilingual research in NLP and linguistics

- Meaningful linguistic analysis across languages
- Syntactic parsing in cross-lingual settings
- NLP systems for multiple languages
- Facilitate resource-building for new languages

Complement – not replace – language-specific schemes

How?

Focus on grammatical relations between (content) words

Who?

Open community effort – a big tent

UD v2.1: 60 languages, 102 treebanks, 214 contributors

Come join us at <http://universaldependencies.org>

Plan for the Talk

Basic principles of UD

The UD annotation framework

- Word segmentation
- Morphological annotation
- Syntactic annotation
- CoNLL-U format

Challenges for UD

Basic Principles

The UD Philosophy

The UD Philosophy

Maximize parallelism – but don't overdo it

- Don't annotate the same thing in different ways
- Don't make different things look the same
- Don't annotate things that are not there

The UD Philosophy

Maximize parallelism – but don't overdo it

- Don't annotate the same thing in different ways
- Don't make different things look the same
- Don't annotate things that are not there

Universal taxonomy with language-specific elaboration

- Languages select from a universal pool of categories
- Allow language-specific extensions

Grammatical Relations

Grammatical Relations

- Widely accepted as a useful level of abstraction in syntax

Grammatical Relations

- Widely accepted as a useful level of abstraction in syntax
- Maps between overt morphosyntax and semantic roles

Grammatical Relations

- Widely accepted as a useful level of abstraction in syntax
- Maps between overt morphosyntax and semantic roles
- Prominent in linguistic typology – comparative concepts

Grammatical Relations

- Widely accepted as a useful level of abstraction in syntax
- Maps between overt morphosyntax and semantic roles
- Prominent in linguistic typology – comparative concepts
- Useful for downstream NLP tasks – shallow semantics

Grammatical Relations

- Widely accepted as a useful level of abstraction in syntax
- Maps between overt morphosyntax and semantic roles
- Prominent in linguistic typology – comparative concepts
- Useful for downstream NLP tasks – shallow semantics
- Traditional concepts familiar to non-specialists

Words

Words

Basic annotation units are words – lexicalism

- Words have properties – morphological annotation
- Words enter into relations – syntactic annotation

Words

Basic annotation units are words – lexicalism

- Words have properties – morphological annotation
- Words enter into relations – syntactic annotation

Primacy of content words – universalism

- Content words are linked by grammatical relations
- Function words are seen as syncategorematic

Annotation Framework

Word Segmentation

What is a word?

- Single part-of-speech tag
- Real syntactic relation

Two-level segmentation

- Represent orthographic tokens **and** syntactic words

Word Segmentation

What is a word?

- Single part-of-speech tag
- Real syntactic relation

Two-level segmentation

- Represent orthographic tokens **and** syntactic words

Text

Words

Word Segmentation

What is a word?

- Single part-of-speech tag
- Real syntactic relation

Two-level segmentation

- Represent orthographic tokens **and** syntactic words

Text	Words
du	de le

Word Segmentation

What is a word?

Syntax

The cat could have chased all the dogs down the street .
DET NOUN AUX AUX VERB DET DET NOUN ADP DET NOUN PUNCT

Syntax

- Content words are linked by grammatical relations

Syntax

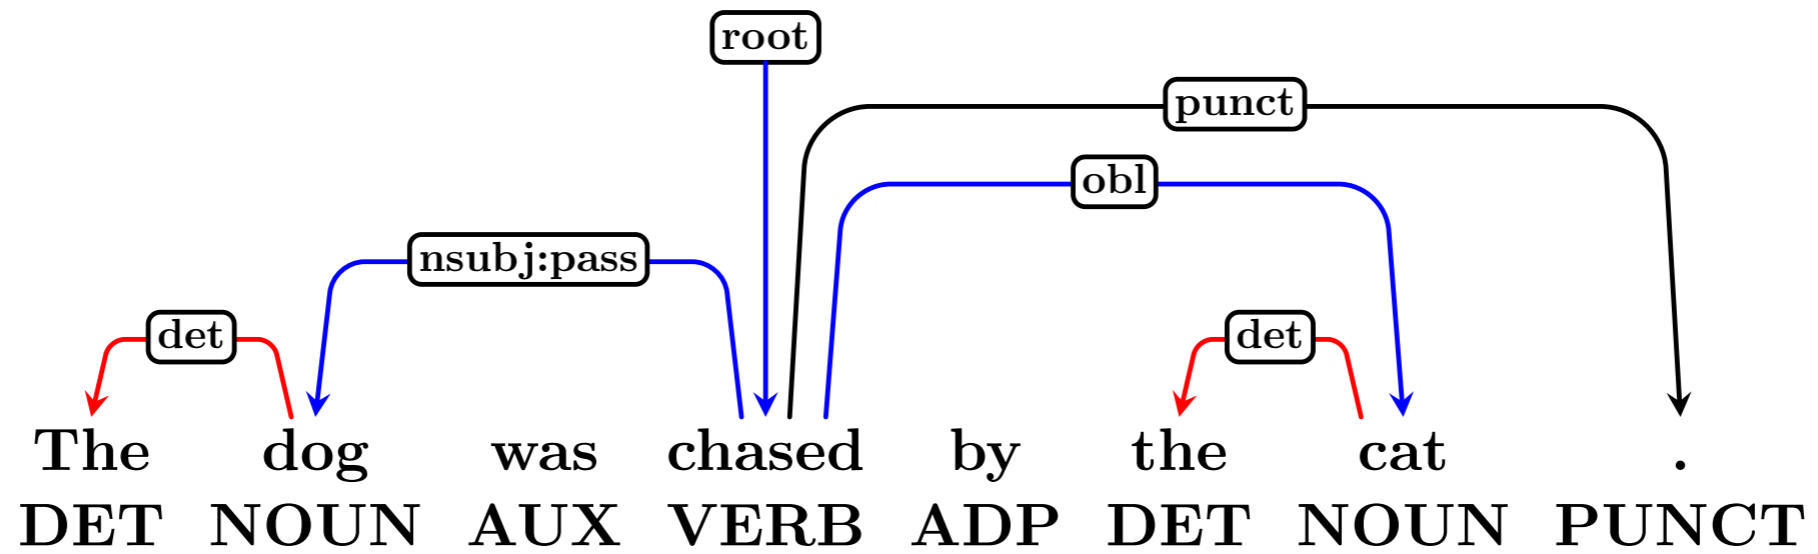

- Content words are linked by grammatical relations
- Function words attach to the content word they modify

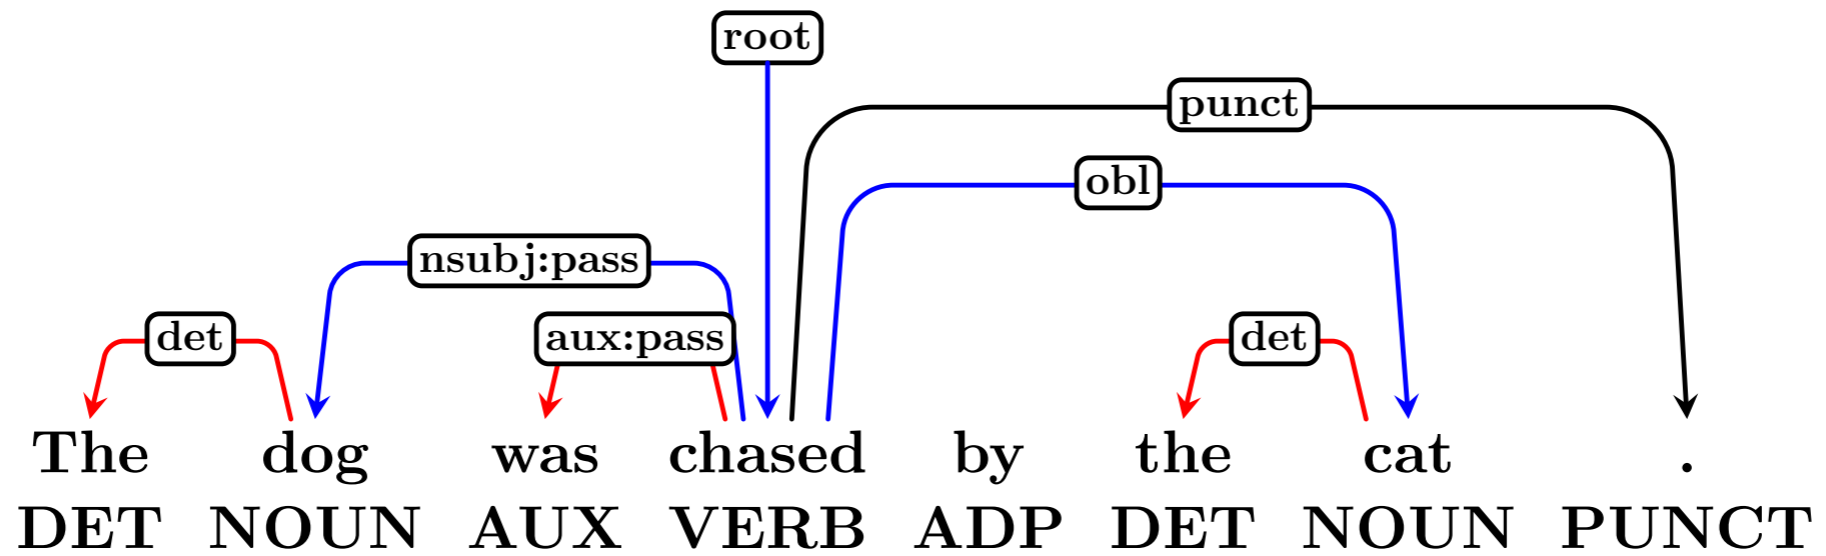

Syntax

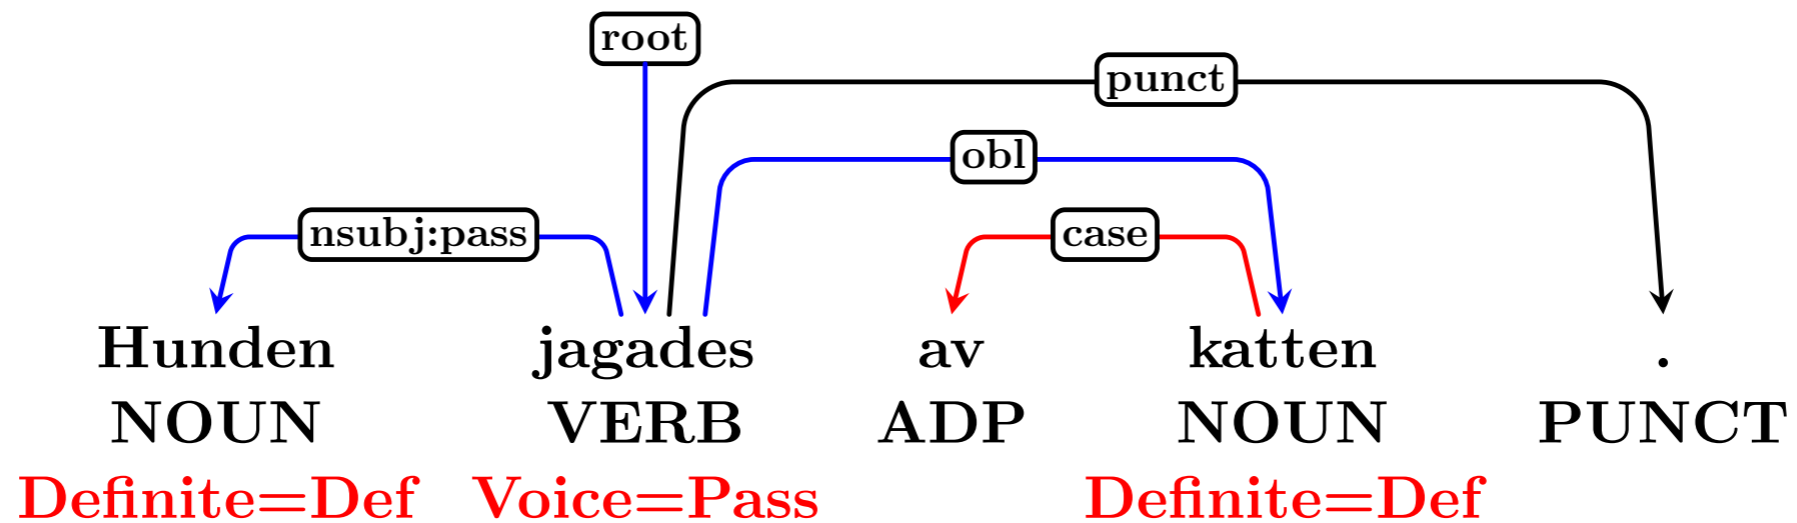

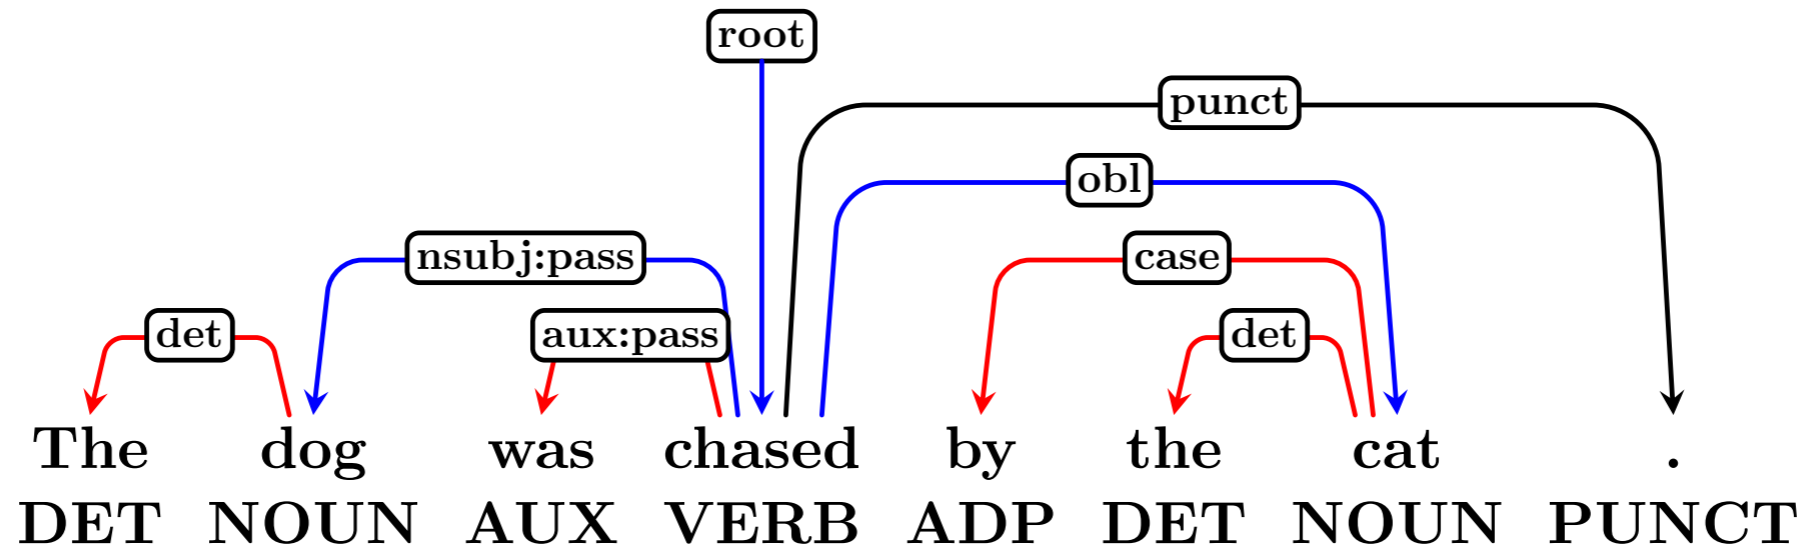

- Content words are linked by grammatical relations
- Function words attach to the content word they modify
- Punctuation attach to head of phrase or clause

Syntactic Relations

Syntactic Relations

Taxonomy of 37 universal syntactic relations

- Three types of structures: nominals, clauses, modifiers
- Core arguments vs. obliques (**not** arguments vs. adjuncts)
- Language-specific subtypes

Syntactic Relations

Taxonomy of 37 universal syntactic relations

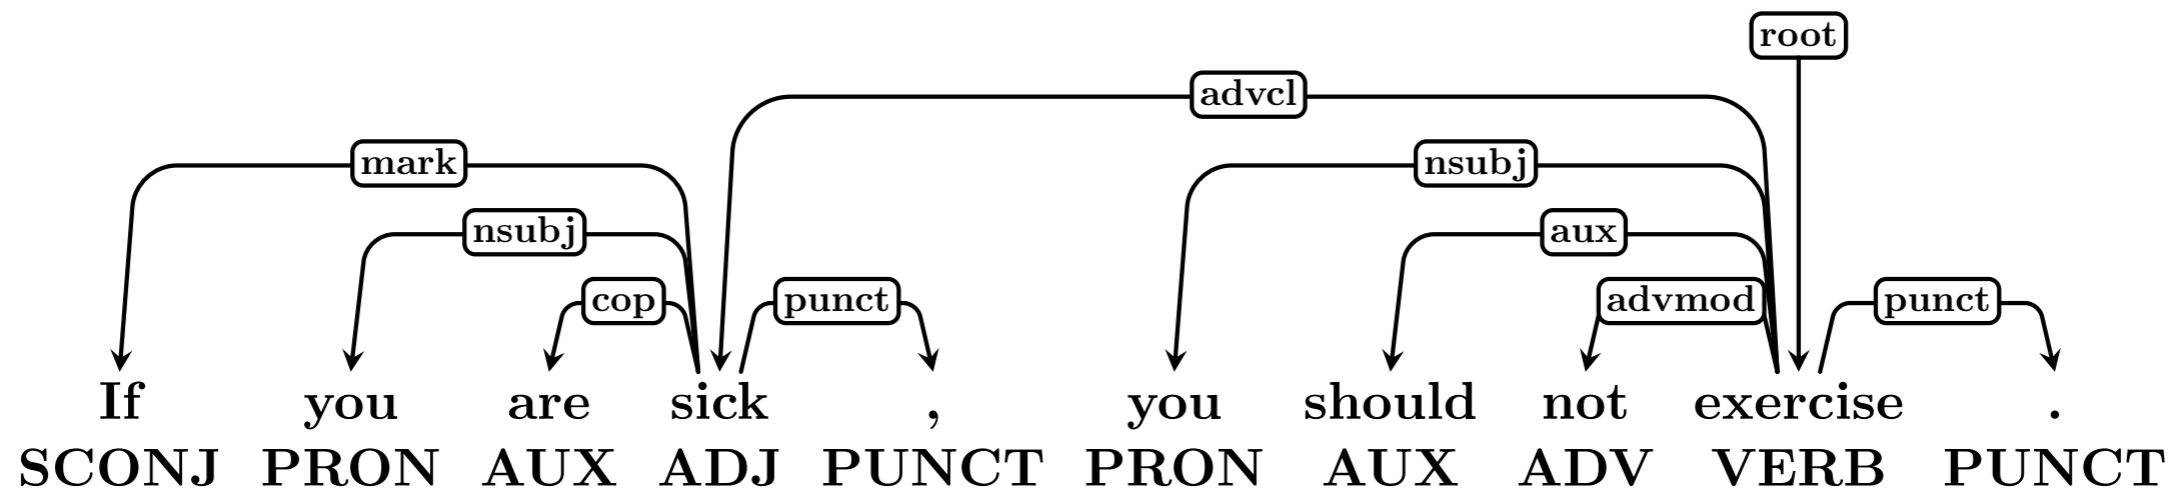

- Three types of structures: nominals, clauses, modifiers
- Core arguments vs. obliques (**not** arguments vs. adjuncts)
- Language-specific subtypes

Basic and enhanced representations

- Basic representation forms a (possibly non-projective) tree
- Additional relations in the enhanced representation

Syntactic Relations

	Nominal	Clause	Modifier Word	Function Word
Core Predicate Dep	nsubj obj iobj	csubj ccomp xcomp		
Non-Core Predicate Dep	obl vocative expl dislocated	advcl	advmod* discourse	aux cop mark
Nominal Dep	nmod appos nummod	acl	amod	det clf case
Coordination	MWE	Loose	Special	Other
conj cc	fixed flat compound	parataxis list	orphan goeswith reparandum	punct root dep

Core Arguments

Core Arguments

Arguments of basic intransitive and transitive verbs

- Verbs usually only agree with core arguments
- Core arguments normally appear as bare nominals without adpositions
- Certain cases, traditionally called nominative, accusative, and absolutive are typically reserved core arguments
- Core arguments often occupy special positions in the clause
- Syntactic phenomena like control, relativization and passivization can be restricted to core arguments

Core Arguments

Arguments of basic intransitive and transitive verbs

- Verbs usually only agree with core arguments
- Core arguments normally appear as bare nominals without adpositions
- Certain cases, traditionally called nominative, accusative, and absolutive are typically reserved core arguments
- Core arguments often occupy special positions in the clause
- Syntactic phenomena like control, relativization and passivization can be restricted to core arguments

Do not confuse

- Core arguments vs. oblique dependents – grammatical encoding
- Arguments vs. adjuncts – valency or subcategorization

Noun Phrases

Nominal	Clause	Modifier Word	Function Word
nmod appos nummod	acl	amod	det clf case

Coordination

Coordinate structures are rooted in the first conjunct

- Subsequent conjuncts depend on it via the **conj** relation
- Conjunction depends on following conjunct via the **cc** relation
- Punctuation depends on following conjunct via the **punct** relation

Multiword Expressions

Only restricted classes of MWEs get special treatment:

- Fixed grammaticized expressions (**fixed**)
- Semi-fixed expressions with no clear head (**flat**)
- Lexical compounds – normally headed (**compound**)

Loose Joining Relations

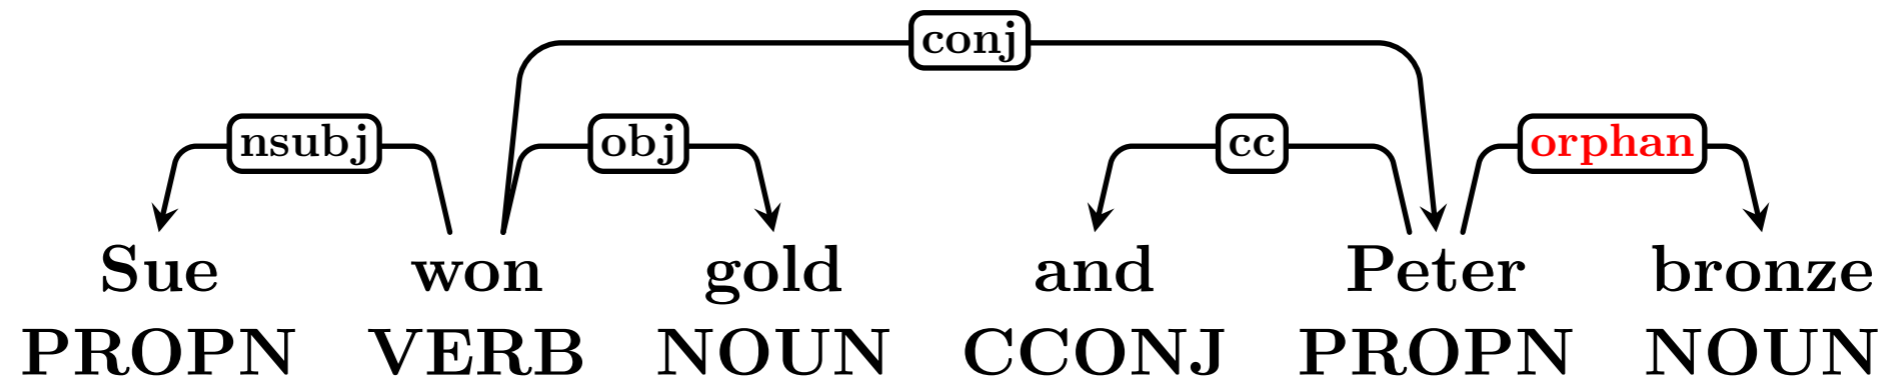

The **parataxis** relation:

- Side-by-side sentences (“run-on sentences”)
Bearded dragons are sight hunters, they need to see the food to move.
- Injective clauses (parentheticals)
Calafia has great fries (they are to die for!) and decent burgers.
- Certain types of reported speech
That guy, he said, left early this morning.
- Tag questions
It's not me, is it?

The **list** relation:

- Chains of comparable items
Steve Jones Phone: 555-9814 Email: jones@abc.edf

Ellipsis

The UD approach to ellipsis (from v2):

1. If the elided word has no children, do nothing.
2. If the elided word has children, promote one of them to be the head.
3. If the elided word is a predicate and the new head a core argument, attach other non-functional elements with the **orphan** relation.

Implicit relations are recovered in enhanced dependencies

Disfluencies

The **reparandum** relation:

- Disfluencies that are overridden in a speech repair

The **goeswith** relation:

- Parts of words resulting from orthographic or editing mistakes

Punctuation

- A punctuation mark separating coordinated units is attached to the following conjunct.
- A punctuation mark preceding or following a subordinated unit is attached to this unit.
- Within the relevant unit, a punctuation mark is attached at the highest possible node that preserves projectivity.
- Paired punctuation marks should be attached to the same word unless that would create non-projectivity.

Special Relations

The **root** relation:

- The word at the root of the dependency tree
- Normally the predicate of the main clause
- Exactly one word in each tree

The **dep** relation:

- Unspecified syntactic relation (when all else fails)

A Two-Level Architecture

- Universal relations to allow cross-linguistic comparison
- Subtypes to capture language-specific phenomena

A Two-Level Architecture

Enhanced Representation

An extended dependency graph containing

- Null nodes for elided predicates
- Additional subject relations for control and raising constructions
- Propagation of dependents over coordination
- Coreference in relative clause constructions
- Labels augmented with function word information

Enhanced Representation

More in Lecture 3

- Additional subject relations for control and raising constructions
- Propagation of dependents over coordination
- Coreference in relative clause constructions
- Labels augmented with function word information

CoNLL-U Format

Challenges

Current Issues

Current Issues

Lack of consistency across (and within) languages

- Guidelines are often not specific enough to determine unique analysis
- Language-specific traditions bias application of guidelines
- Conversion from other annotation schemes add further bias
- Most teams have limited resources for fixing problems

Current Issues

Lack of consistency across (and within) languages

- Guidelines are often not specific enough to determine unique analysis
- Language-specific traditions bias application of guidelines
- Conversion from other annotation schemes add further bias
- Most teams have limited resources for fixing problems

Lack of support for additional annotation

- The UD scheme (and CoNLL-U) is not designed to capture everything
- But everyone wants to encode their favorite linguistic distinction
- Leads to increasing complexity, opaqueness and inconsistency
- Keep UD annotation clean and simple – facilitate additional layers

Manning's Law

The secret to understanding the design (and relative success) of UD is to realize that it is a very subtle compromise between approximately 6 things:

- 1 UD needs to be satisfactory on **linguistic analysis** grounds for individual languages.
- 2 UD needs to be good for **linguistic typology**, i.e., providing a suitable basis for bringing out cross-linguistic parallelism across languages and language families.
- 3 UD must be suitable for **rapid, consistent annotation** by a human annotator.
- 4 UD must be suitable for **computer parsing** with high accuracy.
- 5 UD must be **easily comprehended** and used by a non-linguist, whether a language learner or an engineer with prosaic needs for language processing.
- 6 UD must support well **downstream language understanding tasks** (relation extraction, reading comprehension, machine translation, ...).

It's easy to come up with a proposal that improves UD on one of these dimensions. The interesting and difficult part is to improve UD while remaining sensitive to all these dimensions.

Manning's Law

Ginter's Razor

Changes should not be multiplied beyond necessity!

Thanks to all UD contributors!
