Statistics of cancer incidence and mortality - data and methods

The following section describes the data sources and methods used to prepare annual cancer incidence and mortality reports for Switzerland. Please note that Statistics of cancer incidence and mortality is distributed in different documents. The cancer mortality statistics can be downloaded at http://nicer.org/Editor/files/cancer_incidence.pdf

Data sources

- The registration of cancers in Switzerland is organised at the cantonal level by the cancer registries (RCT). These data are collected and aggregated at the National Institute for Cancer Epidemiology and Registration (NICER). The data currently available online match those provided by 11 cancer registries, covering 15 cantons. This coverage is almost complete for French and Italian-speaking Switzerland, but there are gaps in some major German-speaking regions.
- The Cause of Death Statistics (CD) of the Federal Statistical Office records, for its part, all deaths of persons resident in Switzerland, particularly those caused by cancer.

Registration of new cancer cases in Switzerland

Share of the population covered by a cantonal cancer registry.

	German-speaking Switzerland	French- and Italian-speaking Switzerland	Total Switzerland
1985 - 1989	43.8 %	60.8 %	48.6 %
1990 - 1994	46.6 %	70.8 %	53.6 %
1995 - 1999	46.7 %	82.5 %	57.0 %
2000 - 2004	46.7 %	85.3 %	57.9 %
2005 - 2009	45.2 %	97.7 %	60.7 %

Estimation of incidence

The average incidence rate is calculated in each language region (German-speaking Switzerland and French- and Italian-speaking Switzerland) by pooling cases from the relevant registries and their populations. This rate is determined separately by five-year age group, sex and cancer site. It is applied to the entire region assuming homogeneity of data between the geographical areas that are covered and those that are not covered. The Swiss estimate published by the Federal Statistical Office and NICER corresponds to the sum of estimated cases for each language region.

Data quality

The published trends may on the one hand have been affected by the gradual introduction of the registers and, on the other, by more difficult access to data due to insufficient legal regulation of cancer registration. For example, incidence data for the cantons of Valais and Graubünden were first collected during the 1985-1989 period, data for the canton of Glarus for the first time during the 1990-1994 period, for the canton of Ticino between 1995 and 1999, and for the cantons of Jura and Fribourg during the last period between 2005 and 2009. At the time when the statistical analysis was carried out, the data from the cancer registry of the cantons of Basel-Stadt and Basel-Landschaft were not available for the year 2009.

Moreover, the legal bases for cancer registration differ from one canton to another, which may in some cases result in limited access to the data. In particular, there are indications of under-registration in parts of German-speaking Switzerland for the years 2007 - 2009 (see Jahresbericht 2011, Krebsregister der Kantone Zürich und Zug, Annual Report 2011, Cancer Registry of the cantons of Zurich and Zug)*. Nevertheless, the data included from all cancer registries still meet the quality criteria of the IARC (International Agency for Research on Cancer)**. The combination of all available data helps to improve the representativeness of the results over time; the comparability of the periods is of secondary importance.

*Jahresbericht 2011, Krebsregister der Kantone Zürich und Zug.
